Supplementary Figure 2: Lack of expression of CD133 in human lung cancer cell line A549

A549 cells were stained for CD133 expression and analyzed by FACS. No CD133 positive cells were detected in A549 cells grown either as a monolayer (A) or tumor spheres (B) when compared with a secondary only control (C). The same antibody used to detect CD133 expression in human bone marrow (Fig. S3) was used for this analysis.
