ABOUT THE COVER

Twist1 overexpression increases the ability of a single prostate cancer cell to exert traction force upon its surrounding. On the cover, a representative deformation field image is superimposed with the corresponding intracellular traction maps of a Myc-CaP prostate cancer cell overexpressing Twist1 using constrained Fourier transform traction cytometry. The colors within the cells represent the absolute magnitude of tractions in Pascals, and the arrows represent the relative magnitude and directions. Prostate cancer cells overexpressing Twist1 exhibited higher cell traction force than isogenic vector control cells. See article by Gajula and colleagues (beginning on page 1387) for more information.
