ABOUT THE COVER

Mitotic progression was monitored by confocal fluorescence/differential interference contrast (DIC) images of time lapse from living MCF10A cells incubated in the presence of vehicle or 100 μM citral dimethyl acetal. The image series show chosen frames of images that were collected every 30 s. Hoechst 33258 was used to stain chromatin (blue). Please see the article by Lindström and colleagues (beginning on page 1073) for more information.
