ABOUT THE COVER

The ability of cancer stem cells (CSCs) to develop cancer makes them a viable therapeutic target. However, the mechanisms that regulate CSCs are not well defined. Here, evidence suggests the miR-137/DCLK1 axis as an important regulator in colon CSCs. The cover image is a representative green fluorescent image of a xenograft tumor derived from SW480 cells transduced with miR-137-GFP and DCLK1-mCherry (not shown, see complete figure). For details, see the article by Sakaguchi and colleagues (page 354).
