**ABOUT THE COVER**

IDH1 hotspot mutations are likely early events in gliomagenesis; however, they can be lost in treated secondary glioblastomas. The cover depicts the DNA helix containing CpG island methylation as bright white foci. Though IDH1 mutations are thought to drive a CpG methylation-high phenotype in glioma, Moure and colleagues found that many methylated foci throughout the genome were retained even after CRISPR/Cas9-mediated knockout of the IDH1 mutant allele.
