## ABOUT THE COVER

Benign prostatic hypertrophy (BPH) is a common condition in older men, which can progress to a malignant state over time as cells accumulate tumorigenic features. The cover image depicts immunofluorescence of a mouse prostate harboring telomere DNA damage (red) and smooth muscle hyperplasia (green). Telomere repeat factor 2 (TRF2) deficiency in prostate epithelial cells was found to induce a phenotype that closely resembles human BPH, and mice bearing this lesion eventually developed high-grade prostate tumors with metastatic potential. For more information, see the article on page 1326.
