

Figure S5

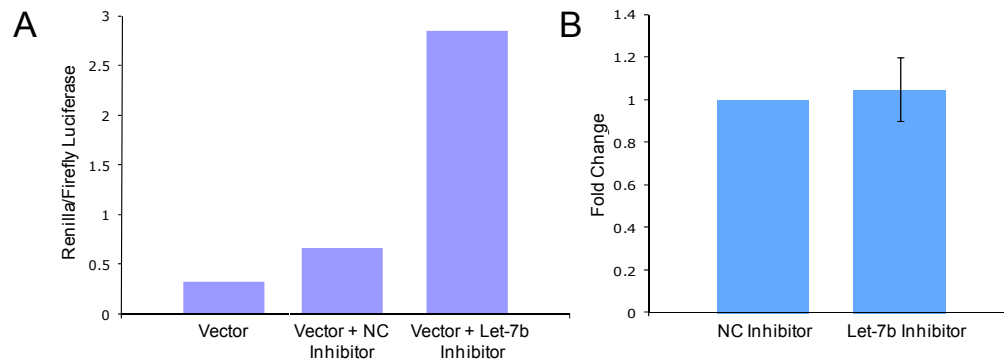

Figure S5. Reduced let-7 family miRNA is unlikely to explain the interferon response. A) To determine the effectiveness of the let-7b inhibitor, the let-7b luciferase vector was transfected into KLE cells along with either negative control (NC) or let-7b inhibitors. The ratio of firefly to renilla (control) luciferase was measured for each combination. B) Negative control or Let-7b inhibitor was transfected into KLE cells. RNA was isolated and Taqman qRT-PCR performed for *IFN β 1*, using β -Actin as a reference gene. Error bars are SD (data shown is the average of two experiments performed in triplicate).
